

CSS Concepts

CSS is mainly used to make the website look attractive to the user. In task-3 I used 2 types of CSS out of 3. Those 2 are:

1. Inline CSS: It defines a single element and apply unique style to a single HTML element.
 2. Internal CSS: Unlike Inline CSS it defines a one whole HTML page rather than a single element.
- Selectors: It is used to find the HTML elements that we want to style. For eg we use selectors like class, id, <p>, <h1>, * etc.

Particularly there was no difficulties or challenges I faced while doing the Task-3. It was all going smooth from the start.
