# Basic HTML Structure

Hyper Text Markup Language(HTML) is used to display or render webpages in the online patform world wide. HTML consists of different elements, which is used to enclose different parts of the content to make it appear a certain way, or act a certain way. HTML elements tell the browser how to display the content. HTML consists of following structure:

<!DOCTYPE>: It tells web browser about the version of HTML being used.

<html> : It is used to specify that the document being used is an HTML document.

<head> : It specifies information about HTML and it's contents are not displayed.

<title> : displays the title of a web page if keywords are appropriate it results in higher ranking in search results.

<body> : specifies the main content of an HTML document that appears on the browser
