Media Queries

Media queries help make the page responsive for different platforms like mobile phones, tablets, desktop. Media Types describe the category of device type. Media type is optional and by default, it is considered as `all` type. There are other media types like screen, print etc. Media Queries helps the developers to create a consistent and optimized user experience across all devices. Without responsive design, websites may appear unstable and broken on certain screens which results in poor user experience. I learned about breakpoints, specific screen widths where design changes occur.

I noticed that while setting a media query for the page with a min-width of 1024px it overwrites the media query for the page with a min-width of 600px. I solved it by adding double media query min and max .
